NOVEMBER 2021 SOIL SAMPLING REPORT

This soil sampling report presents a summary of field activities conducted and analytical data collected at the Goodfellow Federal Center, 4300 Goodfellow Blvd. in St. Louis, Missouri. GSA undertook this sampling according to the Remedial Investigation Work Plan that the Missouri Department of Natural Resources approved in March 2021.

Surface and subsurface soil samples were collected and tested from each of 71 soil borings. The soil samples were tested for several analytical parameters (including metals, polychlorinated biphenyls, polycyclic aromatic hydrocarbons, total petroleum hydrocarbons, volatile organic compounds and/or explosives), which you can get more information at Section 4.0 of this report.

The soil analytical results were compared to project action limits, which are the lowest EPA screening levels for soil. The laboratory results are at Section 5.0 of this report. Surface soil analytical data are summarized in Tables 3 and 4, and subsurface soil analytical data are summarized in Tables 5 and 6. Tables 7 through 10 summarize the number of detections and PAL exceedances.

Arsenic and five polycyclic aromatic hydrocarbons were detected in the soil samples above their respective PALs. The remaining results were either detections below their respective PALs or compounds the lab did not detect.

Additional soil sampling at the exceedance locations will be completed in fiscal year 2022 to define nature and extent, as necessary. Once soil sampling is completed, GSA will complete a baseline human health risk assessment.

These activities are part of the remedial investigation, one step in the CERCLA process, which GSA is following in preparation for transferring ownership of the property sometime around 2024.

If you have any questions, please email r6environmental@gsa.gov, and GSA will provide responses from the appropriate experts.

Please note: The tables and figures in this over 5,700-page plan may not be accessible for people using screen reader technology. The information can be furnished upon request by contacting 816-223-6198 or r6environmental@gsa.gov.

1.0 INTRODUCTION

The General Services Administration (GSA) tasked Burns & McDonnell to conduct a remedial investigation (RI) at the Goodfellow Federal Complex (GFC) to identify, characterize, and delineate contamination that may be present from historical operations. RI activities include installation of 19 monitoring wells, quarterly groundwater sampling of the 19 monitoring wells, and collection of direct-push surface and subsurface soil samples. This Soil Sampling Report presents a summary of field activities conducted and analytical data collected during the soil sampling activities.

The GFC is located at 4300 Goodfellow Boulevard in St. Louis, Missouri and occupies a portion of the former St. Louis Ordnance Plant (SLOP) near the western boundary of the City of St. Louis, Missouri (see Figure 1). The GFC property is owned and operated by the GSA. The GFC encompasses approximately 66 acres, and is bordered northeast by the former SLOP, southeast by Planned Industrial Drive, southwest by Lincoln Way, and northwest by Goodfellow Boulevard. The site location is shown on Figure 2. The GFC is developed with buildings, utility tunnels, and a combined stormwater and sanitary sewer collection system.

The former SLOP was constructed in the early 1940s and fabricated .30 and .50 caliber ammunition. Previous environmental investigations at the GFC and SLOP have identified contamination present in soil and groundwater.

1.1 Project Documentation

The following planning documents provided general guidance for the soil sampling activities:

- The Missouri Department of Natural Resources (MDNR)-approved *Final Remedial Investigation Work Plan; Goodfellow Federal Complex, St. Louis, Missouri* (Work Plan) (Etegra, Inc. [Etegra], 2021), which consist of the following:
    - *Final Field Sampling Plan; Goodfellow Federal Complex, St. Louis, Missouri* (FSP),
    - *Final Quality Assurance Project Plan; Goodfellow Federal Complex, St. Louis, Missouri* (QAPP), and
    - *Final Risk Assessment Work Plan*; *Goodfellow Federal Complex, St. Louis, Missouri* (RA Work Plan)*;*
- *Final Health and Safety Plan for Remedial Investigation Activities at the Goodfellow Federal Complex; St. Louis, Missouri* (HASP) (Burns & McDonnell, 2021a); and

- *Final Site Specific Safety Plan for Remedial Investigation Activities at the Goodfellow Federal Complex; St. Louis Missouri* (SSSP) (Burns & McDonnell, 2021b).

1.2 Objective

The primary objective was to collect sufficient soil data to assess risk to the potential human exposure scenarios identified in the MDNR-approved RA Work Plan. The vertical and horizontal extent of the impacts at the GFC will be assessed to support the human health risk assessment process. To support the objective, the following soil sampling activities were identified:

- Collect surface and subsurface soil samples at 71 boring locations for chemical analysis;
- Collect soil samples at 10 boring locations for geotechnical analysis; and
- Survey the boring locations.

Burns & McDonnell's scope of services completed for this project were conducted in general accordance with the Work Plan. The objectives were completed as identified above.

1.3 Responsible Agency

The MDNR is the regulatory agency responsible for this project. Deliverables will be submitted to MDNR for review and approval.

1.4 Contaminants of Concern

The soil contaminants of concern that are being investigated as part of this RI include the following:

- Metals (antimony, arsenic, copper, lead, and zinc);
- Polychlorinated biphenyls (PCBs) (aroclors 1016, 1221, 1232, 1242, 1248, 1254, and 1260);
- PCB congeners (PCBs-77, 81, 105, 114, 118, 123, 126, 156/157, 167, 169, and 189);
- Polycyclic aromatic hydrocarbons (PAHs);
- Total petroleum hydrocarbons (TPH) (gasoline range organics [GRO], diesel range organics [DRO], and oil range organics [ORO]);
- Volatile organic compounds (VOCs); and
- Explosives.

3.0 FIELD ACTIVITIES

Field activities were completed to meet the project objectives and were conducted in general accordance with the MDNR-approved FSP. The field activities conducted at the GFC during soil sampling activities consisted of the following activities:

- Conduct underground utility locates;
- Collect surface and subsurface soil samples at 71 boring locations for analytical analysis;
- Collect soil samples at 10 boring locations for geotechnical analysis; and
- Survey the 71 boring locations.

3.1 Deviations from Work Plan

Deviations from the MDNR-approved Work Plan are noted below.

- Geotechnical drilling and sampling activities were not included in the MDNR-approved Work Plan; however, during the project contracting phase, it was determined that collection of geotechnical data would be useful for risk assessment modeling. As drilling and soil sampling services were included in the MDNR-approved Work Plan, an addendum to the Work Plan was not prepared. Geotechnical boring activities are presented in Section 3.5.
- Boreholes (direct-push and geotechnical) were abandoned using bentonite chips hydrated in 1-foot lifts versus being abandoned with cement bentonite grout. It should be noted that both abandonment techniques are in compliance with applicable sections of the 10 Code of State Regulations (CSR) Division 23 (Missouri Well Construction Rules), Chapter 4 (Monitoring Well Construction Code) (Missouri Secretary of State, 2019). Borehole abandonment activities are presented in Section 3.6.

3.2 Health and Safety

Burns & McDonnell conducted the fieldwork under a HASP and a SSSP developed for this project. Work was performed using Level D personal protective equipment in accordance with Burns & McDonnell's core safety rules and practices. There were no safety incidents reported during soil sampling activities conducted in July 2021.

3.3 Underground Utility Locates

Burns & McDonnell's drilling subcontractor, Roberts Environmental Drilling, Inc. (REDI) of Milstadt, Illinois, a Missouri-licensed water well driller, contacted the State of Missouri's One Call service to

locate underground utilities prior to commencement of onsite activities. As the GFC is a secured federal facility, no public utilities were marked at the facility.

Burns & McDonnell also subcontracted Baker Utility Partners, LLC (Baker) of St. Louis, Missouri to provide private utility locating services. Baker performed an initial survey of proposed boring locations with a receiver to detect live power or radio frequency signals. The areas were then scanned using a 400-megahertz ground penetrating radar antenna to locate any subsurface anomalies or potential utilities. Baker's private utility locating services were performed on July 12 through 16, 2021, prior to drilling activities.

3.4 Direct-Push Soil Sampling

Seventy-one direct-push soil borings (GB-01 through GB-71) were advanced using direct-push technology by REDI from July 19 through 27, 2021. The locations of the soil borings are illustrated on Figure 3. At each soil boring location, a track-mounted direct-push rig (Geoprobe® 8040DT) was used to advance a MacroCore® sampler and continuously sample the soil. Each soil boring was advanced to a minimum depth of 10 feet below ground surface (bgs), and soil cores were obtained continuously. A Burns & McDonnell field geologist classified the soil cores in general accordance with the Unified Soil Classification System, screened the recovered soil with a photoionization detector (PID) equipped with a 10.6 electron volt (eV) ultraviolet lamp. Based on PID field screening and visual and olfactory observations, if impacts were present at depth, the soil borings were advanced to a depth where impacts were not present. Of the 71 soil borings completed, three were advanced to a depth greater than 10 feet bgs (GB-01 at 13 feet bgs, GB-07 at 13 feet bgs, and GB-40 at 15 feet bgs).

Soil samples for chemical analysis were collected from each of the 71 soil borings. At each soil boring, except GB-01, a single surface and subsurface soil was collected. One surface and two subsurface soil samples were collected at GB-01. Surface soil samples were collected from the 0 to 2-foot interval, if pavement (concrete/asphalt and subbase) was not present. If pavement was present, the representative surface soil sample was collected from a 1- to 2-foot interval immediately below the pavement and associated pavement base aggregate. Of the 71 soil borings completed, 55 were advance through pavement. Pavement thickness in these borings ranged from 0.5 to 5 feet and are summarized on Table 1. Subsurface soil samples were collected from a 1- to 2-foot interval that exhibited the highest impacts based on PID field screening and visual and olfactory observations. If no impacts were detected via PID field screening or observations (visual or olfactory), a shallow subsurface soil sample was collected from a 1- to 2-foot interval immediately below the surface soil sample. Table 1 presents a summary of the

direct-push soil borings and soil samples including depth intervals; survey locations and elevations; analytical analyses; and associated quality assurance (QA)/quality control (QC) samples.

Soil samples for chemical analysis were collected in laboratory provided containers, labeled, and immediately placed on ice in a cooler following sample collection. The cooler was secured with a custody seal prior to shipment. Samples were shipped or provided to a laboratory courier under chain-of-custody to the contract laboratory, Pace Analytical Services, LLC (Pace) of Lenexa, Kansas, a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory.

3.5 Geotechnical Borings

Of the 71 direct-push soil borings, 10 locations (GB-01, GB-07, GB-11, GB-18, GB-22, GB-34, GB-40, GB-47, GB-51, and GB-59) were also drilled as geotechnical borings. Geotechnical borings were advanced within the risk exposure areas defined in the MDNR-approved RA Work Plan. Soil physical properties derived from geotechnical data will be used for risk assessment modeling. Geotechnical borings were drilled by REDI using a track-mounted direct-push rig (Geoprobe® 8040DT) equipped with hollow stem augers (HSAs) on July 27 and 28, 2021. Geotechnical samples were collected by pushing standard 2-foot Shelby tubes through HSAs at discrete depth intervals. Two Shelby tubes and 1-gallon bulk bag samples were collected from each soil boring. One of the Shelby tubes at GB-07 was damaged and was not submitted to the geotechnical laboratory for analysis. Table 2 presents a summary of the geotechnical samples including depth intervals and laboratory analyses.

Soil samples for geotechnical analysis were collected in Shelby tubes provided by the REDI. The geotechnical samples were hand delivered to the geotechnical laboratory, Alpha-Omega Geotech, Inc. (Alpha-Omega) of Kansas City, Kansas.

3.5.1 Geology

Based on the field observations during continuous sampling of the soil borings, the shallow subsurface geology up to 15 feet bgs at the GFC generally consisted of fine-grained deposits composed of silty clay and clay. Free groundwater was not observed in any of the soil borings during direct-push advancement. Lithologic descriptions are presented on the drilling logs provided in Appendix B.

3.5.2 Field Screening

Direct-push soil cores were collected continuously to observe and document soil lithology, color, moisture characteristics, and visual and olfactory indicators of potential impact. Burns & McDonnell field screened soil cores for organic vapors using a PID. This device provides a direct reading in parts per million isobutylene equivalents. Upon removal of the sampler from the borehole, a Burns & McDonnell

geologist field screened recovered soil cores with a PID equipped with a 10.6 eV ultraviolet lamp source. Field screening results for each soil boring are presented on the drilling logs provided in Appendix B.

3.6 Borehole Abandonment

Following sampling, each of the direct-push and geotechnical soil borings were abandoned by REDI using bentonite chips hydrated in 1-foot lifts in accordance with applicable sections of the 10 CFR Division 23 (Missouri Well Construction Rules), Chapter 4 (Monitoring Well Construction Code) (Missouri Secretary of State, 2019). The surface at each boring location was restored to match adjacent surface (i.e., concrete, asphalt, soil). Abandonment activities were completed on the same day the borings were completed. Monitoring Well/Test Hole/Soil and Geotechnical Boring Plugging Registration Reports are provided in Appendix C.

3.7 Decontamination

Decontamination of drilling and sampling equipment was performed prior to beginning soil sampling activities and after completing each soil boring. Drilling and sampling equipment was decontaminated with alconox and potable water. An equipment rinsate blank sample was collected during each day of field work in which decontamination was conducted. Samples were submitted to Pace for analysis of PCBs, PAHs, VOCs, and TPH-GRO.

3.8 Surveying

David Mason & Associates (David Mason) of St. Louis, Missouri, a Missouri-licensed surveyor, surveyed the 71 soil borings on August 2 through 5, 2021. David Mason surveyed the location (northing and easting) and elevation of the ground surface for each of the 71 direct-push soil borings. Geotechnical soil borings were not surveyed as they were completed adjacent to their corresponding direct-push soil borings. A copy of the survey data is provided in Appendix D, and the survey data is summarized in Table 1.

3.9 Investigation-Derived Waste

Investigation-derived waste (IDW) generated from soil sampling activities (e.g., soil cuttings and decontamination water) were containerized onsite. Soil cuttings and decontamination water were added to the roll off containers and 300-gallon totes that were used during monitoring well installation activities. The characterization and disposal of this IDW is documented in the *Goodfellow Federal Complex Monitoring Well Installation Summary Report; Goodfellow Federal Complex; St. Louis, Missouri* (Burns & McDonnell, 2021c). Used personal protective equipment and general trash were disposed of as municipal solid waste.

The geotechnical soil samples were submitted under chain-of-custody to Alpha-Omega. Table 2 presents a summary of the geotechnical samples including depth intervals and laboratory analyses.

5.0 ANALYTICAL RESULTS

Surface and subsurface soil analytical results were compared to project action limits (PALs) for solid samples listed in Table 1 of the MDNR-approved QAPP (see Exhibit 1). Surface soil analytical data are summarized in Tables 3 and 4, and subsurface soil analytical data are summarized in Tables 5 and 6. Copies of the laboratory analytical reports are provided in Appendix E.

5.1.3.7 Total 2,3,7,8-Tetrachlorodibenzo-p-Dioxin Toxicity Equivalents

None of the surface soil samples analyzed for PCB congeners analysis had calculated lower bound (LB), medium bound (MB), or upper bound (UB) confidence limit total 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD) toxicity equivalences (TEQs) greater than the respective total 2,3,7,8-TCDD TEQ PAL of 4.8 ng/kg. Calculated LB, MB, and UB total 2,3,7,8-TCDD TEQs in surface soil are summarized on Table 4.

To compare the analytical results of the individual PCB congeners to the media-specific PAL for 2,3,7,8-TCDD, the total 2,3,7,8-TCDD TEQ for each sample analyzed was calculated. Determining the total 2,3,7,8-TCDD TEQ is a two-step process. The first step is to determine the LB, MB, UB confidence limit TEQs for each individual PCB congener. In Step 2, the TEQs for the individual congeners are summed to determine the LB, MB, and UB total 2,3,7,8-TCDD TEQs. The total 2,3,7,8-TCDD TEQ calculation process is presented below:

Step 1

$$TEF_i \times {}^{LB}C_i = {}^{LB}TEQ_i$$

Where:
TEF_i = Toxicity equivalence factor of an individual PCB congener
${}^{LB}C_i$ = Lower bound concentration of an individual PCB congener (where non detects = 0)
${}^{LB}TEQ_i$ = Lower bound toxicity equivalent concentration of an individual PCB congener

$$TEF_i \times {}^{MB}C_i = {}^{MB}TEQ_i$$

Where:
TEF_i = Toxicity equivalence factor of an individual PCB congener
${}^{MB}C_i$ = Medium bound concentration of an individual PCB congener (where non detects = limit of detection [LOD]/2)
${}^{MB}TEQ_i$ = Medium bound toxicity equivalent concentration of an individual PCB congener

$$TEF_i \times {}^{UB}C_i = {}^{UB}TEQ_i$$

Where:
TEF_i = Toxicity equivalence factor of an individual PCB congener
${}^{UB}C_i$ = Upper bound concentration of an individual PCB congener (where non detects = LOD)
${}^{UB}TEQ_i$ = Upper bound toxicity equivalent concentration of an individual PCB congener

Toxicity equivalence factors (TEFs) have been developed to reflect the variability in toxicity between the different PCB congeners. The World Health Organization's 2005 consensus TEFs (Van den Berg et al., 2006) were used for the calculations presented above. TEFs used are presented on Tables 4 and 6.

Step 2

$$\Sigma({}^{LB}TEQ_i) = \text{Total 2,3,7,8-TCDD } {}^{LB}TEQ$$

Where:
${}^{LB}TEQ_i$ = Lower bound toxicity equivalent concentration of an individual PCB congener
Total 2,3,7,8-TCDD ${}^{LB}TEQ$ = Total lower bound calculated toxicity equivalence for 2,3,7,8-TCDD

$$\Sigma({}^{MB}TEQ_i) = \text{Total 2,3,7,8-TCDD } {}^{MB}TEQ$$

Where:
${}^{MB}TEQ_i$ = Medium bound toxicity equivalent concentration of an individual PCB congener
Total 2,3,7,8-TCDD ${}^{MB}TEQ$ = Total medium bound calculated toxicity equivalence for 2,3,7,8-TCDD

$$\Sigma({}^{UB}TEQ_i) = \text{Total 2,3,7,8-TCDD } {}^{UB}TEQ$$

Where:
TEQ_i = Upper bound toxicity equivalent concentration of an individual PCB congener
Total 2,3,7,8-TCDD ${}^{UB}TEQ$ = Total upper bound calculated toxicity equivalence for 2,3,7,8-TCDD

6.0 GEOTECHNICAL RESULTS

A total of 19 undisturbed soil samples were collected from 10 geotechnical boring locations and submitted to Alpha-Omega for testing of the geotechnical methods identified in **Section 4.2**. Results of the geotechnical data are summarized in the sections below. Geotechnical results are provided in the geotechnical laboratory reports which are provided in Appendix F.

6.1 Moisture Content

The moisture content of soil is described as the ratio of the mass of water held in the soil to the dry soil. The moisture content in geotechnical soil samples ranged from 18.0 percent (%) at GB-18/6-8 to 28.1% at GB-59/8-10. The measured moisture contents were consistent with the measured moisture contents form the analytical samples and field observations.

6.2 Dry Bulk Density

Dry bulk density of soil is defined as the ratio of mass of soil to the total volume of soil. The dry bulk density in geotechnical soil samples ranged from 93.0 pounds per cubic foot (pcf) at GB-59/2-4 to 110.0 pcf at GB-18/6-8. Measured dry bulk densities were in the typical range for compacted fine-grained material (silt and clay).

6.3 Fraction of Organic Carbon

FOC is a dimensionless mass measure of the quantity of soil organic carbon relative to soil media. FOC can be used to estimate the capacity of a soil to adsorb or bind certain contaminants. The FOC in geotechnical soil samples ranged from 0.004 grams of carbon per grams of soil (g-c/g-soil) at GB-51/2-4 to 0.027 g-c/g-soil at GB-18/6-8.

6.4 Grain Size Analysis

Grain size analysis is a test that determines the relative proportions of divergent grainsizes as they are distributed among certain size ranges. Grain size analysis of the geotechnical soil samples indicated that all the geotechnical samples were primarily comprised of fine-grained material (silt and clay) at various proportions with very minor components of sand. Material from all but one sample (GB-18/2-4), had 96% or more passing No. 200 sieve. Silt composition ranged from 86.7% at GB-51/2-4 to 35.2% at GB-18/6-8 and the clay composition ranged from 13.2% at GB-51/2-4 to 64.7% at GB-11/6-8. Results of the grain size analyses are consistent with what was recorded on drilling logs during monitoring well installation and soil sampling activities.

6.5 Porosity

Soil porosity is a unitless measure that refers to the fraction of the total soil volume that is taken up by the pore space. Pore spaces facilitate the availability and movement of air or water within the soil environment. The porosity in the geotechnical soil samples ranged from 0.340 at GB-18/6-8 to 0.446 at GB-59/2-4. Calculated porosities were in the typical range for compacted fine-grained material (silt and clay).

QUALIFIERS

Project: GSA GOODFELLOW
Pace Project No.: 60375481

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

BATCH QUALIFIERS

Batch: 734572

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results for this analyte in associated samples may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
N2	The lab does not hold NELAC/TNI accreditation for this parameter but other accreditations/certifications may apply. A complete list of accreditations/certifications is available upon request.
R1	RPD value was outside control limits.
c2	Acid preservation may not be appropriate for the analysis of 2-Chloroethylvinyl ether.

DISCUSSION

This report presents the results from the analyses performed on three samples submitted by a representative of Pace Analytical Services, Kansas. The samples were analyzed for the presence or absence of the twelve dioxin-like polychlorinated biphenyl (PCB) congeners using USEPA Method 1668A. Reporting limits were set to signal-to-noised based estimated detection limits based on the amount of dry sample weight extracted. Revision 1 was prepared to reduce the analyte list to include only the dioxin-like PCB congeners and to report to the EDLs. Revision 2 was prepared to correct the client sample identifications. Please note that the IDs provided on the CoC were not updated.

The dilution levels noted on the data tables is being adjusted to allow the correct data flags to populate the electronic deliverables as well as the data tables. Samples and MDL extracts were analyzed at elevated volumes. That volume is being treated as a 1x dilution for calculation purposes, with larger dilutions being factored from that volume.

The recoveries of the isotopically-labeled PCB internal standards in the sample extracts ranged from 46-88%. All of the laboratory spike results tables, the isotopically-labeled PCB internal standards in the extracts were recovered within the target ranges for this method. Since the quantification of the native PCB congeners was based on internal standard and isotope dilution methodology, the data were automatically corrected for variation in recovery and accurate values were obtained.

It should be noted that the extracts from this project were double spiked with cleanup standards. The additional standard was taken into account with the calculation of cleanup recoveries. Cleanup standards are used to troubleshoot recovery issues with the internal standards. Their use is not associated with quantitation, and does not impact the PCB content determinations.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to produce signal at the retention time of congeners 156/157 and to contain trace levels of several other PCB congeners. Congeners present in the sample extracts at levels similar to the method blank were flagged "B" and may have originated in the laboratory.

A laboratory spike sample was also prepared with the sample batch using a reference matrix that had been fortified with native standards. The results show that the spiked native compounds were recovered at 105-115%. These results were within the target ranges for this method. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from that analysis will be provided

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

COD	Coefficient of Determination.
(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
Mass	Mass of parameter.
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
RT	Retention Time.
SDG	Sample Delivery Group.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Wavelength	Wavelength of parameter.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
